Introduction

 The Alexander-Whitney coproduct is functorial with respect to simplicial maps.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ──○へ⊙

Justin Smith

Drexel University

Introduction

- The Alexander-Whitney coproduct is functorial with respect to simplicial maps.
- ► If X is a simplicial set, C(X) is the unnormalized chain-complex and RS₂ is the *bar-resolution* of Z₂, it is also well-known that there is a unique homotopy class of Z₂-equivariant maps (where Z₂ transposes the factors of the target)

$$\xi_X: \mathsf{RS}_2 \otimes C(X) \to C(X) \otimes C(X)$$

《口》《聞》《臣》《臣》

and that this extends the Alexander-Whitney diagonal.

Introduction

- The Alexander-Whitney coproduct is functorial with respect to simplicial maps.
- ► If X is a simplicial set, C(X) is the unnormalized chain-complex and RS₂ is the *bar-resolution* of Z₂, it is also well-known that there is a unique homotopy class of Z₂-equivariant maps (where Z₂ transposes the factors of the target)

$$\xi_X: \mathsf{RS}_2 \otimes C(X) \to C(X) \otimes C(X)$$

and that this extends the Alexander-Whitney diagonal.

 In his construction of cup-*i* products, Steenrod defined a dual of this map.

We can make this *functorial* too, so any simplicial map

 $f: X \to Y$

induces a commutative diagram

Drexel University

イロト イ団ト イヨト イヨト

Natural question

Given a purely algebraically-defined chain-map

 $g: C(X) \to C(Y)$

that makes the diagram

commute

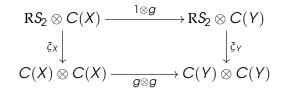

Justin Smith

Natural question

Given a purely algebraically-defined chain-map

$$g: C(X) \to C(Y)$$

that makes the diagram

commute

What can we say about X and Y?

Justin Smith

Drexel University

< ロ > < 同 > < 三 > < 三 > -

It turns out (with *many* qualifications) that such a chain-map induces a simplicial map

$g_\infty:\mathbb{Z}_\infty X\to\mathbb{Z}_\infty Y$

of \mathbb{Z} -completions "strongly related to g''

Drexel University

イロト イ団ト イヨト イヨト

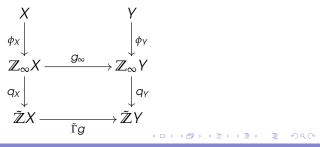

Justin Smith

More precise statement

In (7), I prove that if X and Y are pointed, reduced, degeneracy-free simplicial sets and $g: N(X) \rightarrow N(Y)$ is a chain-map of *normalized* chain-complexes that preserves the Steenrod diagonals, then there exists a simplicial map

$$g_\infty:\mathbb{Z}_\infty X o\mathbb{Z}_\infty Y$$

that makes the diagram

 Let X be a simplicial set with functorial higher diagonal

 $h: \mathbf{RS}_2 \otimes C(X) \to C(X) \otimes C(X)$

・ロト・日本・日本・日本・日本・今日・

Justin Smith

Drexel University

 Let X be a simplicial set with functorial higher diagonal

$$h: \mathbb{R}S_2 \otimes C(X) \to C(X) \otimes C(X)$$

► Let $\Delta = h([] \otimes *): C(X) \rightarrow C(X) \otimes C(X)$ — the Alexander-Whitney diagonal

Justin Smith

Drexel University

《口》《聞》《臣》《臣》

 Let X be a simplicial set with functorial higher diagonal

$$h: \mathbf{RS}_2 \otimes C(X) \to C(X) \otimes C(X)$$

- ► Let $\Delta = h([] \otimes *): C(X) \rightarrow C(X) \otimes C(X)$ the Alexander-Whitney diagonal
- Let $\Delta_2 = h([(1,2)] \otimes *): C(X) \to C(X) \otimes C(X).$

イロト イ団ト イヨト イヨト

Justin Smith

 Let X be a simplicial set with functorial higher diagonal

$$h: \mathbf{RS}_2 \otimes C(X) \to C(X) \otimes C(X)$$

- ► Let $\Delta = h([] \otimes *): C(X) \rightarrow C(X) \otimes C(X)$ the Alexander-Whitney diagonal
- Let $\Delta_2 = h([(1,2)] \otimes *): C(X) \to C(X) \otimes C(X).$

Then

$$\partial \{ (1 \otimes \Delta) \circ \Delta_2 \} = (1 \otimes \Delta) \circ \partial \Delta_2$$

= $(1 \otimes \Delta) \circ \{ (1, 2) - 1 \} \Delta$
= $(1, 2, 3) (\Delta \otimes 1) \circ \Delta - (1 \otimes \Delta) \circ \Delta$
= $\{ (1, 2, 3) - 1 \} (1 \otimes \Delta) \circ \Delta$

Justin Smith

In (4), Smirnov asserted that the integral homotopy type of a space is determined by a coalgebra-structure on its singular chain-complex over an E_∞-operad.

《口》《聞》《臣》《臣》

- In (4), Smirnov asserted that the integral homotopy type of a space is determined by a coalgebra-structure on its singular chain-complex over an E_∞-operad.
- Smirnov's proof was somewhat opaque and the community still has not assimilated it.

Drexel University

< ロ > < 同 > < 回 > < 回 >

Justin Smith

- In (4), Smirnov asserted that the integral homotopy type of a space is determined by a coalgebra-structure on its singular chain-complex over an E_∞-operad.
- Smirnov's proof was somewhat opaque and the community still has not assimilated it.
- Although some even questioned the result's validity, the work discussed here appears to vindicate it.

《口》《聞》《臣》《臣》

Justin Smith

In (6), the author showed that the chain-complex of a space was naturally a coalgebra over an E_∞-operad 𝔅 and that this could be used to iterate the cobar construction (in a paper that was also opaque and unassimilated).

< ロ > < 同 > < 回 > < 回 >

- In (6), the author showed that the chain-complex of a space was naturally a coalgebra over an E_∞-operad 𝔅 and that this could be used to iterate the cobar construction (in a paper that was also opaque and unassimilated).
- The paper (5) applied those results to show that this G-coalgebra determined the integral homotopy type of a simply-connected space.

Steenrod Coalgebras

The Hurewicz map is so-named because it induces the *Hurewicz homomorphism* in homotopy groups

$$\pi_n(h_X):\pi_n(X)\to\pi_n(\mathbb{Z} X)=H_n(X,\mathbb{Z})$$

It is used to define the cosimplicial \mathbb{Z} -resolution, $\mathbb{Z}^{\bullet}X$, of X:

$$\tilde{\mathbb{Z}}X \stackrel{\partial^i}{\Rightarrow} \tilde{\mathbb{Z}}^2X \to \cdots$$

where the coface maps are defined by $\partial^{i} = \tilde{\mathbb{Z}}^{n-i+1} \circ h^{*}_{\tilde{\mathbb{Z}}^{i}X}$, i = 0, ..., n.

Drexel University

《口》《聞》《臣》《臣》

Justin Smith

Define a chain-map

$$N(\tilde{\mathbb{Z}}X) \to C(X)$$
$$I \cdot \left(\sum_{i} \alpha_{i} \sigma_{i}\right) \mapsto \sum_{i} \alpha_{i} \sigma_{i}$$

by extending \mathbb{Z} -linearly, where C(X) is the *unnormalized* chain-complex.

Since X has degenerate simplices, there is no chain-map $N(\mathbb{Z}X) \rightarrow N(X)$ that is *injective on simplices*, but there *is* one to C(X).

《口》《聞》《臣》《臣》

Define a chain-map

$$N(\tilde{\mathbb{Z}}X) \to C(X)$$
$$I \cdot \left(\sum_{i} \alpha_{i} \sigma_{i}\right) \mapsto \sum_{i} \alpha_{i} \sigma_{i}$$

by extending \mathbb{Z} -linearly, where C(X) is the *unnormalized* chain-complex.

- Since X has degenerate simplices, there is no chain-map $N(\mathbb{Z}X) \rightarrow N(X)$ that is *injective on simplices*, but there *is* one to C(X).
- This induces a unique coalgebra-morphism

$$\gamma: \mathcal{N}(\tilde{\mathbb{Z}}X) \to L_{\mathscr{F}}(C(X))$$

▶ If X is a degeneracy free simplicial set with unnormalized chain complex C(X), there is an inclusion $N(X) \rightarrow C(X)$.

Justin Smith

Drexel University

《口》《聞》《臣》《臣》

- ▶ If X is a degeneracy free simplicial set with unnormalized chain complex C(X), there is an inclusion $N(X) \rightarrow C(X)$.
- This induces a unique coalgebra morphism

$$\beta: \mathcal{N}(X) \to L_{\mathscr{F}}(\mathcal{C}(X))$$

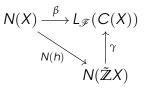

Incidentally, this is the reason we need X to be degeneracy-free.

Justin Smith

If *h* is the Hurewicz map, the *uniqueness* of those morphisms implies that the diagram

commutes.

If Δ^n is an *n*-simplex, Steenrod showed that

$$\xi_{\Delta^n}(e_n\otimes [\Delta^n])=\pm [\Delta^n]\otimes [\Delta^n]$$

where $e_n \in (RS_2)_n$ is the generator and $[\Delta^n]$ is the element of $N(\Delta^n)_n$ generated by Δ^n .

Justin Smith

Drexel University

イロト イポト イヨト イヨト

If Δ^n is an *n*-simplex, Steenrod showed that

$$\xi_{\Delta^n}\left(\boldsymbol{e}_n\otimes [\Delta^n]\right)=\pm [\Delta^n]\otimes [\Delta^n]$$

where $e_n \in (RS_2)_n$ is the generator and $[\Delta^n]$ is the element of $N(\Delta^n)_n$ generated by Δ^n .

If X is a simplicial set and we map the Steenrod coalgebra of $\tilde{\mathbb{Z}}X$ to $L_{\mathscr{F}}(C(X))$, we get a diagram

$$N(\mathbb{Z}X) \to L_{\mathscr{F}}(C(X)) \to \prod_{k\geq 1} C(X)^{\otimes k}$$

where a simplex $c \in \tilde{\mathbb{Z}}X_n$ maps to

 $\{{\tt C},{\tt C}\otimes{\tt C},{\tt C}\otimes{\tt C}\otimes{\tt C},\dots\}$

when evaluated on $\{e_n, e_n \circ_1 e_n, \dots\}$.

If $\{c_1, \ldots, c_k\} \in \tilde{\mathbb{Z}}X$ are distinct elements, it is not hard to see that their images under the map

$$N(\tilde{\mathbb{Z}}X) \hookrightarrow N(\tilde{\mathbb{Z}}X) \otimes \mathbb{Q} \to L_{\mathscr{F}}(C(X)) \otimes \mathbb{Q} \to \prod_{k \ge 1} C(X)^{\otimes k} \otimes \mathbb{Q}$$

are linearly independent.

- What Steenrod coalgebras are topologically realizable?
- Must have an action of the Eccles-Barratt operad, \mathfrak{S} .
- One can define a *cellular* Steenrod coalgebra as one in which the image of the classifying map

$$\alpha: C \to L_{\mathcal{F}} C \to L_{\mathscr{F}}(\{\tilde{\Gamma} C\})$$

lies within that of

$$\beta: \mathcal{N}(\tilde{\Gamma}C) \hookrightarrow \mathcal{L}_{\mathscr{F}}(\{\tilde{\Gamma}C\})$$
